

Access & Permissions Checklist

BEXT Consultancy — Business Structure Efficiency (Brief B) · 11 August 2026

Every credential, permission and platform setting the automation depends on, where to find it, and which workflow stops working without it. Status verified against the live APIs, not assumed.

1. Status at a glance

Item	Status	Owner	Blocks
Entra app registration	DONE	Complete	—
Graph permissions (10) + consent	DONE	Complete	—
Teams transcription policy	DONE	Complete	—
SharePoint folders	DONE	Complete	—
Teams application access policy	BLOCKED	Brent — Teams admin	Meeting Intake — all of it
HubSpot companies scope	PARTIAL	HubSpot app owner	Client matching, filing, drafts
Xero connection	NOT STARTED	Brent — Xero admin	Finance automation
ProjectManager hourly rates	NOT SET	Brent — data entry	Profitability reporting
Company minutes template	STAND-IN	Gabriel / Brent	Branded output only
Teams Administrator role	RECOMMENDED	Brent	Future admin tasks

2. Microsoft 365 — the core of the build

Tenant: bextconsultancy.com.au · 9eb458d1-317d-4aae-a9a3-bb68e430d701

Application: BEXT Automation (Dev) · b72d1df4-06ec-4390-937a-1293f34d31be

Service account: Admin.bext-automation@bextconsultancy.com.au

2.1 App registration and client secret DONE

Where: Microsoft Entra admin center → Applications → App registrations → *BEXT Automation (Dev)* → Certificates & secrets

Link: [entra.microsoft.com](#) → App registrations

HOW IT CONNECTS

The client secret is exchanged for an access token via the OAuth2 client-credentials flow. Every Microsoft call in every workflow starts here. Credentials live in `.env` and are passed to the n8n container as `MS_*` environment variables — never inline in workflow JSON.

REFERENCE

[Client credentials flow — Microsoft Learn](#)

WATCH

Secrets expire. When this one does, every Microsoft workflow stops at once. *BEXT — Graph Health* checks daily and emails on failure, which is the early warning.

2.2 Graph API permissions — all ten consented DONE

Where: Entra admin center → App registrations → *BEXT Automation (Dev)* → API permissions. All are **Application** permissions, not Delegated — the workflows run unattended with nobody signed in.

Permission	What it enables	Workflow that needs it
Mail.Send	Send mail as a user	Daily Report (05:00), Graph Health alerts
Mail.ReadWrite	Create drafts, move messages	Meeting Intake — follow-up drafts; email filing (B.4)
Mail.Read	Read mailbox content	Email automation review (B.4)
Calendars.ReadWrite	Read and write calendar events	Meeting Intake — meeting discovery
OnlineMeetings.Read.All	Find Teams meetings	Meeting Intake — resolve event to meeting
OnlineMeetings.ReadWrite.All	Meeting records	Meeting Intake
OnlineMeetingTranscript.Read.All	Download the transcript itself	Meeting Intake — needs §2.4 as well
Sites.ReadWrite.All	SharePoint sites and libraries	Minutes filing, template retrieval, document management (B.5)
Files.ReadWrite.All	OneDrive and drive items	Document filing (B.5)
User.Read.All	Resolve users and attendees	All — the meetings API needs the user's object GUID

Reference: [Graph permissions reference](#) · [Graph API overview](#)

Note: consent was granted by `Brent@bextconsultancy.com.au` . The service account holds no directory roles and cannot grant consent itself — see §2.5.

2.3 Teams transcription policy DONE

Where: Teams admin center → Meetings → Meeting policies → *Global (Org-wide default)* → Recording & transcription → **Transcription: On**

Link: admin.teams.microsoft.com/policies/meetings

HOW IT CONNECTS

Decides whether Teams *produces* a transcript at all. Without it there is nothing for the workflow to read, no matter what permissions exist. Applies only to meetings held after it was switched on.

REFERENCE

[Teams transcription — Microsoft Learn](#)

2.4 Teams application access policy **BLOCKED — ACTION REQUIRED**

Verified error: 403 – No application access policy found for this app b72d1df4-06ec-4390-937a-1293f34d31be on the user

WHY IT EXISTS

Separate from consent by design. A tenant-wide transcript permission would otherwise let the application read every meeting in the organisation, so Microsoft requires an administrator to name which users an application may read. Consent alone always returns 403 — this is not a misconfiguration.

WHERE

PowerShell only. There is no portal page and no Graph API for it — the sole interface is the MicrosoftTeams PowerShell module, signed in as a Teams administrator.

COMMANDS (RUN BY BRENT, ONCE)

```
Install-Module MicrosoftTeams -Scope CurrentUser -Force -AllowClobber
Connect-MicrosoftTeams -AccountId Brent@bextconsultancy.com.au
New-CsApplicationAccessPolicy -Identity BEXT-Automation-Policy -AppIds "b72d1df4-06ec-4390-937a-1293f34d31be" -Description "BEXT Automation transcript access"
Grant-CsApplicationAccessPolicy -PolicyName BEXT-Automation-Policy -Identity Admin.bext-automation@bextconsultancy.com.au
```

Scripted and idempotent at `graph/teams-access-policy.ps1` . Allow up to 30 minutes to take effect.

REFERENCE

[Application access policy](#) — Microsoft Learn · [List transcripts API](#)

BLOCKS

The entire meeting workflow: transcript retrieval, minutes generation, action extraction, follow-up drafts. Brief B review area 3 — the client's stated highest priority.

2.5 Teams Administrator role **RECOMMENDED**

Where: Entra admin center → Users → *Admin.bext-automation* → Assigned roles → Add assignments → **Teams Administrator**

Link: entra.microsoft.com → Users

WHY

The service account currently holds **no** directory roles, which is why the Teams admin center returns `INVALID_PRIVILEGE` and why every Teams task has to be escalated to Brent. Teams Administrator is sufficient for meeting and application policies and does not give a service account control of the tenant — deliberately not Global Administrator.

3. SharePoint — where documents live

3.1 Existing structure VERIFIED

The tenant already carried a considered architecture. It was extended, not replaced.

Site	Structure	Role
BEXTHQ	API Automation Folder → Knowledge Hub - Industry, Meeting Recordings, Shared Documents	Internal and automation working area
CRM	Clients → Clients, Opportunities (Arup, Caterpillar, Deakin, RACV, Sustainnovate)	Pre-contract pipeline
ProgramManagement	Client NNN → Project → 00. Admin + Gate 01–11	Post-contract delivery
CommercialManagement	Finance Mgt → Cash Inflows, Cash Outflows	Finance — the Xero boundary

3.2 Folders added for the meeting workflow DONE

Path (under BEXTHQ)	Holds
API Automation Folder/Templates/	The minutes template the workflow fills
API Automation Folder/Meeting Transcripts/	Raw Teams VTT, archived before processing
API Automation Folder/Meeting Minutes/	Generated minutes, awaiting review

Created by: `node graph/provision-sharepoint.js` — idempotent, refuses to overwrite.

API: `GET /sites/{host}:/sites/BEXTHQ → /drives → PUT /drives/{id}/root:/{path}:/content` · [DrivelItem reference](#)

Open decisions: where client minutes finally file, naming convention, transcript retention — `docs/sharepoint-ia.md`

4. Third-party platforms

4.1 HubSpot PARTIAL — SCOPE MISSING

Verified: contacts and deals return 200. Companies returns 403 – This app hasn't been granted all required scopes to make this call.

Portal: HubSpot → Settings (gear) → Integrations → **Private Apps** → the app → **Scopes** tab → add `crm.objects.companies.read` (and `.write` if the automation should create records) → Save → the token stays valid.

Link: app.hubspot.com/private-apps · Portal ID 443333225

HOW IT CONNECTS

Companies is how any workflow answers "which client is this?" — the lookup behind filing a document to the right folder, matching a meeting to an engagement, and addressing a client update. Contacts and deals alone cannot resolve that.

REFERENCE

[Companies API](#) · [Scopes reference](#)

Also outstanding: the portal holds 1 sample deal and 0 companies. Until real data exists, client matching has nothing to match against.

4.2 Xero NOT STARTED

Steps: developer.xero.com/app/manage → New app → Web app → OAuth 2.0 → note Client ID and Secret → connect it to the BEXT organisation and authorise the scopes.

Scopes needed: `accounting.transactions`, `accounting.contacts`, `offline_access` (refresh tokens — without it the connection dies after 30 minutes).

HOW IT CONNECTS

Xero owns invoices and expenses in the architecture. It feeds the CommercialManagement site and, combined with ProjectManager time, project profitability.

REFERENCE

[Xero OAuth 2.0 · Accounting API](#)

Owner: Brent — financial data, authorised by an organisation administrator.

4.3 ProjectManager CONNECTED — DATA INCOMPLETE

Verified: token works, 13 projects readable. **All 13 have** `hourlyRate = 0`.

Where: ProjectManager → Account → API, and per project → Settings → Rate

HOW IT CONNECTS

ProjectManager is the real system of record for delivery. Its project list is what lets automated filing resolve a destination folder. Without hourly rates, profitability cannot be computed — which is the main purpose of the Xero–ProjectManager integration. Either rates are entered, or that integration is descope'd and the final report says why.

REFERENCE

developer.projectmanager.com

4.4 WordPress, LinkedIn, Canva DECISIONS NEEDED

Platform	What is required	Constraint
WordPress	Application password: WP Admin → Users → Profile → Application Passwords; REST API at <code>/wp-json/wp/v2/</code>	Straightforward once credentials are issued
LinkedIn	App at developer.linkedin.com , Marketing Developer Platform access	Feed scraping is not permitted. Monitoring as briefed is not available through the API — scope needs an honest decision before 25 Aug
Canva	Connect API — canva.dev/docs/connect	Template automation is limited; Word output is the more reliable path

5. Internal services — all operational

Service	Where	Role
n8n 2.32.6	<code>bext-n8n.srv1866850.hstgr.cloud</code>	Runs every workflow. Repo is source of truth, not the UI
PostgreSQL 16	VPS, loopback only	Articles, reports, meeting minutes, health
fetcher	Internal Docker network	Headless browser; <code>/render-docx</code> fills the minutes template

Gemini	Google AI API	Article scoring; transcript extraction
SMTP	Credential in n8n	05:00 daily report and alerts
Dashboard	bext.dev-environment.site	Status, reports, proposal deck

6. Licensing — needs Brent's attention

Subscription	Purchased	Assigned
Business Premium + Copilot	2	2
O365 Business Premium	0	1

One licence is assigned from a subscription with no purchased units — the signature of a lapsed or cancelled subscription with the assignment still attached. It sits on `Admin.bext-automation@`, the mailbox that sends the 05:00 report, and a lapsed licence degrades mail and Teams access quietly rather than all at once. Check at admin.microsoft.com → Billing → Your products. Note there are **no spare licences** in the tenant.
