

Industry Daily Report

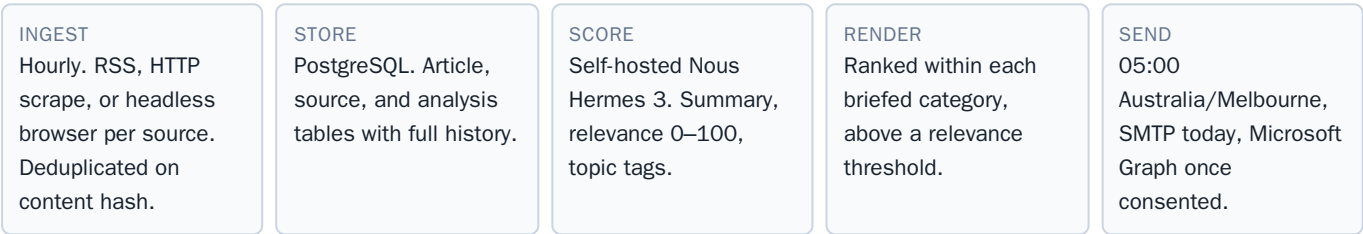

Solution Mapping — Engagement A, deliverable due 11 August 2026
Drafted 7 August 2026 · figures measured live from the running system, not projected

1. What the brief asked for

A single consolidated news sheet, delivered by email at 05:00 AEST every day, covering industry sources across five named categories, so that the consultant stays current without reading sixty websites.

The system is built and running. It is not a proposal — reports have been generated and delivered on 6 and 7 August 2026. The remaining work to 18 August is refinement, not construction.

2. Solution architecture

Every component is self-hosted on infrastructure that transfers to BEXT at handover. There is no per-article cost and no third-party platform holding the data — which is what the companion brief asks for and what keeps the running cost to a single VPS.

Why three ingest methods rather than one

- The sixty-eight briefed sources do not behave alike. Testing each one individually established that:
- 26 publish a usable RSS feed — cheapest and most reliable, and carries real publication dates.
 - 29 need HTML scraping — no feed exists, or the feed is a stub. Eleven government feeds return valid RSS containing zero items, which looks healthy from outside and yields nothing.
 - 15 refuse automated HTTP entirely — including AEMO, DCCEEW, DEECA, VicGrid and SEC Victoria. These sit behind bot protection that answers a plain request with a challenge page. A headless-browser service solves the challenge and reads the page as a browser would.

The browser path exists because those blocked sources are the Australian energy regulators. Dropping them was not an option the brief allows.

3. Source coverage

CATEGORY	SOURCES	RSS	HTTP SCRAPE	BROWSER	INACTIVE
Australian News	4	0	4	0	0
Industry Updates	52	23	20	10	1
International Industry Updates	12	3	5	5	3
Total	68	26	29	15	4

Every URL was recovered from the hyperlinks embedded in the brief PDF, so the registry matches what was actually specified rather than an interpretation of the source names.

Two categories deferred by the brief itself

Grants / Funding Updates and LinkedIn Industry Behaviour are marked in the brief as “link to other report” — a later deliverable. They are represented in the sheet as sections pointing to that separate report, not silently omitted.

LinkedIn needs a scope decision. The brief asks for the feed to be scrolled for all latest posts. LinkedIn's terms prohibit automated scrolling and their API does not expose the feed. Workable alternatives are the Pages API for company content, or a curated source list. This is a platform limit, not an effort limit.

4. Current operating state

MEASURE	VALUE
Articles ingested	1,835 since 31 July
Sources producing articles	47 of 68
Articles scored by AI	1,799 (98%)
Mean relevance score	41.7 / 100
Above the reporting threshold	880
Reports generated and sent	2 — 6 and 7 August

Source health

STATUS	COUNT	MEANING
ok	49	Fetches and returns articles on the last run
error	11	Fetch failed — under investigation before 18 August
empty	4	Fetches successfully, no articles found
never run	4	The four deactivated sources below

The AI scoring discriminates correctly. A national small-scale renewables scheme scored 95; a business banned from an energy efficiency program scored 85; low-relevance overseas consumer items scored below 40 and were excluded. The mean of 41.7 across everything ingested, against 880 items above threshold, shows the filter is doing real work rather than passing everything through.

5. Sources that cannot be reached, and why

SOURCE	BARRIER	RECOMMENDATION
Reuters	Returns 401 to every automated request; subscription-gated	Needs a licensed feed or paid seat — commercial decision
S&P Global	Returns 403 to plain HTTP and to headless Chromium	Subscriber content — commercial decision

DCCEEW	Hard 403 with no solvable challenge, both methods	Seek an alternative route; minister feed partially substitutes
IEA Energy Efficiency	The brief links this to the same page as IEA	Deduplicated — IEA already covers it

Reuters and S&P Global require a paid subscription. No technical approach reaches them without one, and attempting to circumvent the paywall would be neither lawful nor appropriate. This needs a decision: licence them, or accept the gap and record it in the final scope.

6. What remains before 18 August

#	ITEM	STATUS
1	Investigate the 11 erroring sources and repair or retire each	in progress
2	Australian News category yield — 4 sources, none with RSS, thin output	in progress
3	Switch delivery from SMTP to Microsoft Graph	awaiting admin consent
4	Marketing platform health section	not started
5	Decision on Reuters and S&P Global licensing	client decision
6	Decision on LinkedIn scope	client decision
7	Observe several consecutive 05:00 sends unattended	running

Items 1, 2, 4 and 7 are ours. Items 3, 5 and 6 need something from the client — consent, or a commercial decision. None of them prevents the daily report continuing to run in the meantime.

7. Marketing platform health — outstanding

The brief asks that the sheet also report on the health of the marketing platforms alongside the industry news. The platforms are not yet connected, so this section is not yet built. It is the largest single gap remaining against the brief and is scheduled before 18 August.

8. Method

All figures were read directly from the production database on 7 August 2026. Source classification came from testing each of the sixty-eight URLs individually — feed discovery, plain HTTP fetch, then headless browser — rather than assuming behaviour from the site name. Where a source is recorded as unreachable, that reflects an observed HTTP response, and the response code is stored against the source.
