

BEXT Industry Daily — how it works

Fetching, scoring, filtering and delivery · methodology & a worked example from 24 August 2026

This document explains, end to end, how the daily report is assembled: how every source is read, how each article is scored for relevance to BEXT's business, how the noise is separated from the news, and exactly what happens to a real day's 104 articles.

1 · The pipeline, in five steps

Everything is retained in the database. Filtering decides what is *presented*, never what is kept.

2 · How scoring works

Every article is scored 0–100 by relevance to one specific business: an Australian energy-efficiency consultancy working on **existing commercial buildings**, with Victoria as its main market. The single test is: *could this change what BEXT advises a building owner to do, what a project costs, or what the rules require?*

The score bands

80–100 — act on this week. Australian regulatory change, Victorian schemes, market rule changes, or funding a client could act on now.

55–79 — solid industry news. Projects, technology, policy direction, credible research with practical bearing.

20–54 — tangential. Real energy content but remote from their work, or overseas news with no Australian read-across.

0–19 — out of scope. Not energy/building/climate, foreign items with no local read-across, site navigation, promotion, obituaries, early-stage lab research.

Solar comes first

Solar and PV are the core of the business, so the scorer ranks on a priority ladder rather than treating all in-scope topics equally:

- **Tier 1 — Solar / PV a commercial owner could act on:** rooftop and behind-the-meter systems, batteries paired with solar, feed-in and export rules, connection and inverter standards, panel supply and pricing, accreditation, and the schemes that fund them (Solar Victoria, VEU solar measures, the federal rebate).
- **Tier 2 — Building energy performance:** NABERS, Commercial Building Disclosure, the National Construction Code, GEMS, efficiency upgrades, electrification away from gas, heat pumps.
- **Tier 3 — Wider energy market:** generation, transmission, network rules, national policy — genuine context, ranked below the two tiers above.

Two deliberate traps

A regulator publishing something is not a regulatory change. An AER or AEMC decision, rule change or forward-looking speech is high value; a Q&A, an explainer, a graduate program or an annual report is not — however central the regulator.

Early-stage laboratory research scores low even when it is about solar. A new cell chemistry or a lab efficiency record changes nothing a consultant advises this year. Research earns 55+ only when a practitioner could act on it now.

3 · How filtering works

The score is the single dial. Three surfaces read it at three different lines, because they serve different purposes.

Surface	Floor	Contains	Purpose
Email (to the client)	16+	Everything relevant, all sections, no upper limit	The comprehensive daily digest — the full run-down, minus the noise.
Teams card	40+	Top 5 solar + up to 15 more energy items	A curated glance for the channel — the strongest items, solar first.
Dashboard (full record)	0	Every article fetched, including noise	The complete audit trail — proves what was caught and what was rejected.

The noise line: why 16

The client's instruction was precise: scores **1 to 15 are noise and not wanted; everything 16 and above belongs in the email**. The scorer places genuinely off-topic material at or below 15, so cutting at 16 removes exactly that band while keeping every real article above it — including the weak-but-on-topic 20–39 items. A second guard, `report_eligible`, separately holds back archive material discovered in bulk (e.g. 2022–2023 articles unlocked by a parser fix) so old stories are never presented as today's news.

4 · Fetch → Relevant → Noise, defined

Term	Means	Example (24 Aug)
Fetched	Retrieved from a source and stored. Everything starts here.	All 104 articles across 3 sections.
Relevant / news	Scored 16+. Genuine, on-topic content that reaches the email.	44 articles — RenewEconomy solar stories, AEMO guidance, NABERS updates.
Noise	Scored 1–15. Off-topic, foreign with no local read-across, or site navigation mistaken for an article.	55 items — AEMO menu pages, European heatwaves.
Irrelevant	Scored 0. Nothing to do with energy, buildings or climate.	5 items in Australian News.

5 · Worked example — 24 August 2026

104 FETCHED	44 IN THE DAILY NEWS (16+)	55 NOISE (1–15)	5 IRRELEVANT (0)
----------------	-------------------------------	--------------------	---------------------

By section

Section	Fetches	In news (16+)	Noise (1–15)	Zero
Industry Updates	73	40	33	0
International Industry Updates	20	3	17	0
Australian News	11	1	5	5
Total	104	44	55	5

Per-source checklist — every source that published on 24 Aug

Source	Route	Fetches	In news	Noise	Top score
Industry Updates					
AEMO	scrape	40	17	23	70
RenewEconomy	RSS	8	8	0	72
PV Magazine Australia	RSS	5	5	0	72
Energy Magazine	RSS	4	3	1	50
Eco Generation	RSS	3	3	0	65
The Fifth Estate	RSS	3	2	1	68
DCCEEW	scrape	3	1	2	25
Energy.gov.au — News	RSS	1	1	0	30
Infrastructure Magazine — FM	RSS	5	0	5	12
Facility Management Association	scrape	1	0	1	10
International Industry Updates					
Renewables Now	scrape	18	3	15	45
NZ Herald — Energy	scrape	1	0	1	15
S&P Global — Energy Transition	scrape	1	0	1	10
Australian News					
ABC News — Energy	scrape	1	1	0	30
Australian Financial Review — Energy	scrape	5	0	2	10
ABC News — Climate Change	scrape	3	0	3	15
The Conversation AU — Environment	scrape	2	0	0	0

The other ~45 monitored sources published nothing on 24 Aug (a Sunday). That is normal weekend behaviour, not a gap — the coverage-verification checklist confirms all 64 are reachable.

Why 60 items were held out of the email

The 60 excluded (55 noise + 5 zero) fall into three clear groups. The single largest is **AEMO navigation pages** — the scraper reads AEMO's site menu as if each entry were an article. These are not stories at all, and the score correctly rates them 15.

Score	Item	Why held out	
15	AEMO — "Wholesale Electricity Market (WEM)"	navigation	Site menu page, not an article
15	AEMO — "National Electricity Market (NEM)"	navigation	Site menu page, not an article
15	AEMO — "Gas Bulletin Board (GBB)"	navigation	Site menu page, not an article
15	AEMO — "Current and closed consultations"	navigation	Index page, not a story
15	ABC — "'Exceptional' summer heatwaves in Europe"	off-topic	Foreign climate, no energy/building angle
12	Infrastructure Magazine — 5 facilities items	tangential	FM content with no energy read-across
10	AFR — 2 energy-company items	tangential	Corporate news, no client bearing
10	S&P Global — commodity note	off-topic	Overseas markets, no local read-across
0	The Conversation — 2 items	irrelevant	No energy/building/climate content

The key point: excluding the 60 costs no real news. The bulk is AEMO menu pages the scraper mistook for articles; the rest is foreign or tangential. Every genuine Australian energy, solar or building story from 24 Aug is in the 44 that reached the email.

6 · The three surfaces on 24 Aug

Surface	Items	What it showed
Comprehensive email (client)	44	All relevant, three sections, solar-led, no cap
Teams channel card	20	5 solar + 15 energy, "View more" → full list
Dashboard / full record	104	Everything fetched, including the 60 held out
